11 **Questions and help** 39

How to read this guide. To start, follow chapters 2 and 3. To trade real money: chapter 4 (automatic on Binance) or chapter 5 (by hand on any exchange).

Before you trade. ForecastsPro is software, not financial advice. Its analysis is AI-generated and can be wrong, and crypto trading can lose money: trade only money you can afford to lose.

CHAPTER 01

Welcome to ForecastsPro

The AI proposes, limits written in code decide. Automatic on Binance, by hand on any exchange.

Your money stays in your own account: ForecastsPro never holds it, and the AI cannot change your limits.

How one analysis works

STEP 1

The AI reads

Each coin's price history, Bitcoin and the whole market, the market mood (Fear & Greed) and the times of big US economic news, plus any news source you connect.

STEP 2

It proposes

One decision per coin, with a size, a confidence and its reasons.

STEP 3

The gate decides

It checks every decision. Too large: made smaller. Against a rule: blocked, never sent.

STEP 4

Your mode decides the rest

The app places it on Binance, or on paper in Paper, or you place it by hand. With trading off, nothing is placed.

Four trading modes

Trade real money automatically on Binance (chapter 4), or by hand on any exchange (chapter 5). Or start with Paper (chapter 3).

Off

Analysis only. No orders. A new account starts in Off.

Manual

You place each trade yourself, on any exchange. No exchange keys.

Real money

Live trading: real money from your own Binance account. Automatic orders, within two limits you set.

Paper

Paper trading: no real money. On Binance's live prices, with no exchange keys and no Binance account.

What you need

- [ ] **Your ForecastsPro account** (chapter 2).
- [ ] **An AI key** from Anthropic (recommended) or OpenAI. The provider bills you for what you use.
- [ ] **For Real money:** a Binance key. Paper and Manual mode need no exchange key.
- [ ] **Optional:** Telegram for alerts, and news keys.

CHAPTER 02

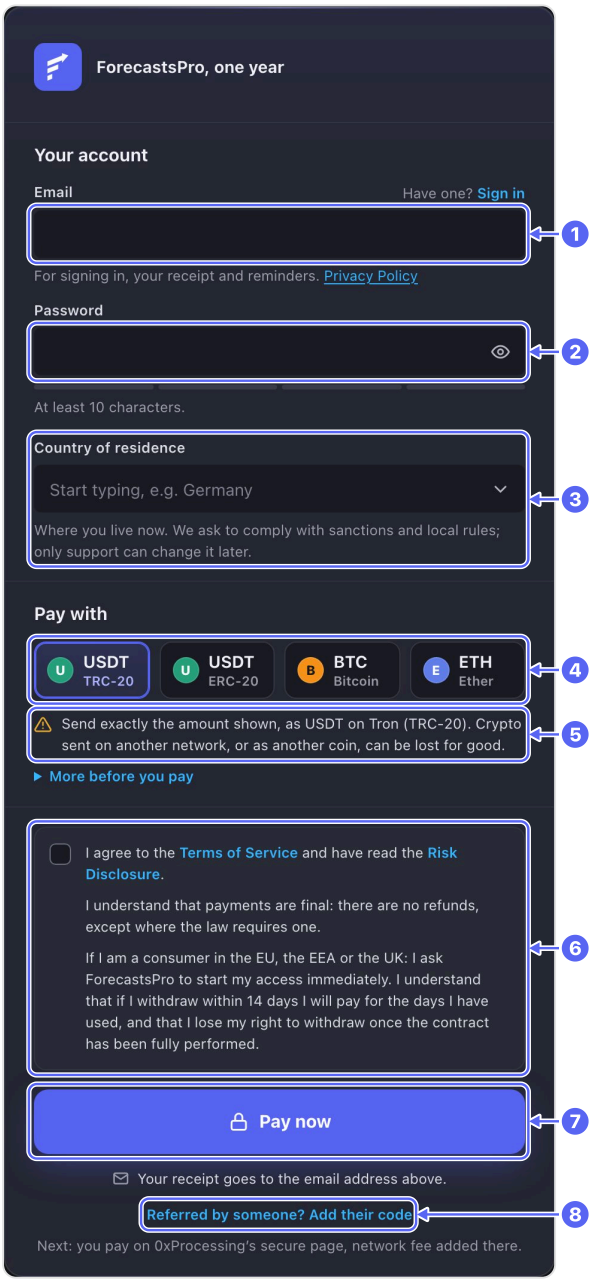
Getting started

Your account, your email and your first analysis.

1 Create your account and pay

Open the checkout page at app.forecastspro.com/checkout. Fill in the form, tick the box and press the pay button.

Have a code from someone? Before you pay, on the checkout or the Billing page, press **Referred by someone? Add their code** and type it. If you came through their link, there is nothing to type.

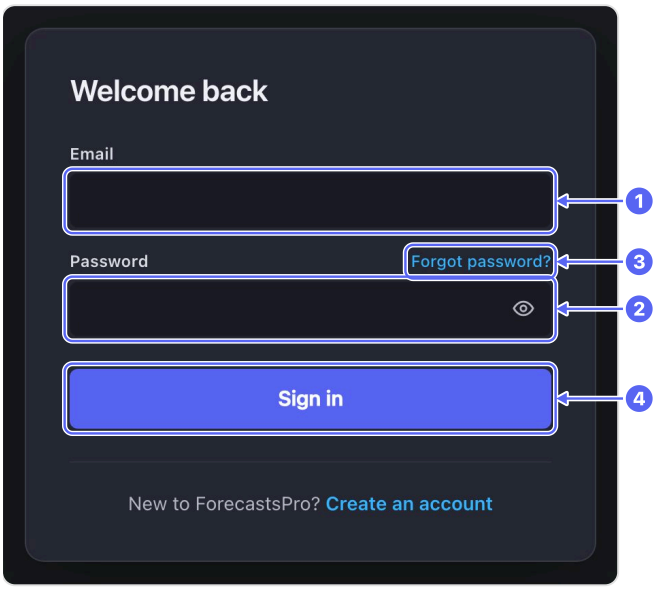


The checkout page (signed out).

#	NAME	WHAT IT DOES
1	**Email**	Your sign-in address. Your receipt, reminders and password resets go here.
2	**Password**	At least 10 characters. You sign in with it.
3	**Country of residence**	Where you live now. Only support can change it later.
4	**Pay with**	USDT on TRC-20 or ERC-20, BTC or ETH.
5	**Network warning**	Send exactly the coin and network shown. A payment on another network can be lost.
6	**Agreement box**	Accept the Terms and confirm you read the Risk Disclosure.
7	**Pay**	Creates your account and opens the secure 0xProcessing payment page.
8	**Referred by someone?**	Add the code they gave you. Their link already carries it.

On the payment page, send exactly the amount, coin and network it shows, within about 30 minutes. Your access starts once the payment is confirmed, usually within minutes, and runs for 365 days. Your receipt comes by email.

The checkout signs you in on that browser. Elsewhere, sign in at app.forecastspro.com.



The sign-in page.

#	NAME	WHAT IT DOES
1	**Email**	Your account's email address.
2	**Password**	The eye button shows what you typed.
3	**Forgot password?**	Sends a reset link to your email.
4	**Sign in**	Opens your dashboard. A session lasts up to 72 hours on each device.

Invited by email? Press **Set your password** in the email and follow the page: it confirms your email and signs you in. If your invitation has a price, pay on the page that opens. Then go to step 3.

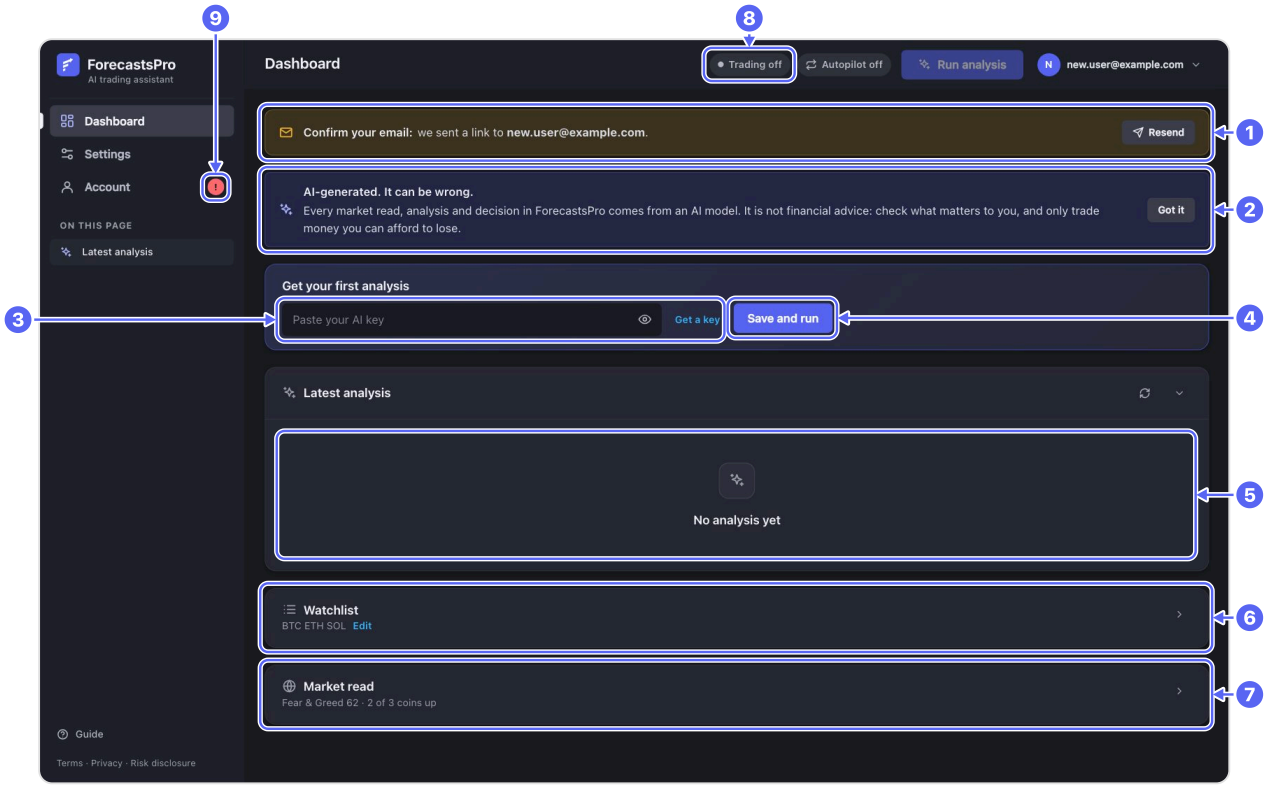
2 Confirm your email

Press **Confirm your email** in your receipt email. Until you do, a banner in the app reminds you, with **Resend**.

Wrong address? Within 48 hours, before you confirm it, press **Change email address** on your Account page.

3 Your first analysis

Your dashboard opens with the welcome card. Press **Get a key**, create your AI key on the page that opens, and add credit there (chapter 3).



A new account: the welcome card, with trading off.

#	NAME	WHAT IT DOES
1	**Confirm your email**	Stays until you confirm your address (step 2). Resend sends the link again.
2	**AI notice**	Shown once per session: every analysis is AI-generated and can be wrong.
3	**Paste your AI key**	Paste your AI key here. Get a key opens the page where you create one.
4	**Save and run**	Saves the key and runs your first analysis.
5	**Latest analysis**	No analysis yet. Your result shows here.
6	**Watchlist**	BTC, ETH and SOL to start. Edit changes them.
7	**Market read**	Folded: the market's mood in one line.
8	**Mode badge**	Your mode. A new account has trading off. Press it to open Trading mode in Settings.
9	**Account needs you**	The ! means an action is waiting on your Account page.

THE TWO WELCOME STEPS

1. **Get your first analysis.** Paste your AI key and press **Save and run**.
2. **One step left: Start autopilot.** Press **Start**: Settings opens on the Autopilot card (chapter 3).

With an Anthropic key, the most capable AI model thinks it through: your first analysis can take a few minutes. Trading is off, so nothing is bought.

CHAPTER 03

Set it up

Your AI key, your trading mode and autopilot. The rest is optional.

A new account already has a budget, a risk level and three coins. Paste your AI key (step 1), then pick how you trade:

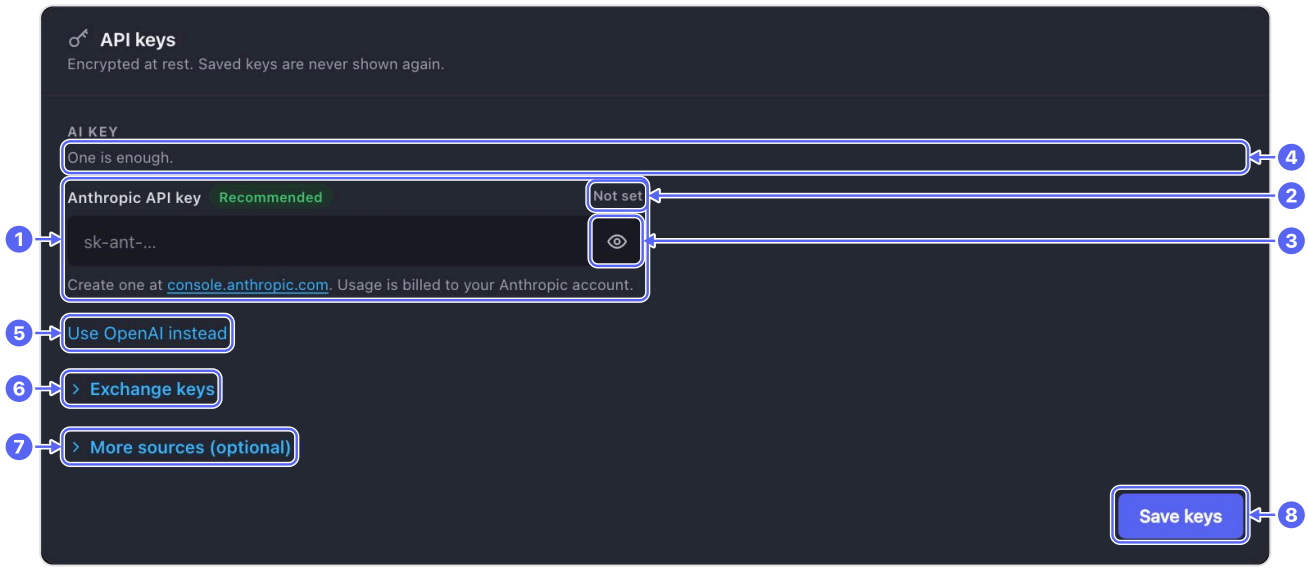
- **Live trading: real money from your own Binance account.** Follow chapter 4.
- **Manual mode: by hand on any exchange.** Tap **Manual** on the **Trading mode** card (chapter 5), then step 3.
- **Paper trading: no real money.** Follow steps 2 and 3.

1 Your AI key

The AI runs on your own AI key. The provider bills you for what you use: from about $18 a month with our top AI model, from about $4 with a lighter one. Add credit there first.

- **Anthropic (recommended):** create a key at console.anthropic.com.
- **OpenAI:** create a key at platform.openai.com.

Paste the key into the welcome card and press **Save and run**. To change it later: the **API keys** card in Settings.



Settings, API keys, on a new account.

#	NAME	WHAT IT DOES
1	**Anthropic API key**	Recommended. Usage is billed to your Anthropic account.
2	**Key tag**	Not set, Set, Connected or Rejected. A rejected key says why under its field.
3	**Show / hide**	Shows what you typed before you save. Saved keys are never shown again.
4	**AI key**	One is enough.
5	**Use OpenAI instead**	Opens the OpenAI API key field.
6	**Exchange keys**	Your Binance key for Real money: trade-only. Paper needs none.

#	NAME	WHAT IT DOES
7	**More sources (optional)**	CryptoPanic, X and Reddit keys add news and social posts.
8	**Save keys**	Encrypts and saves what you typed. Blank fields keep their current value.

No exchange keys for Paper

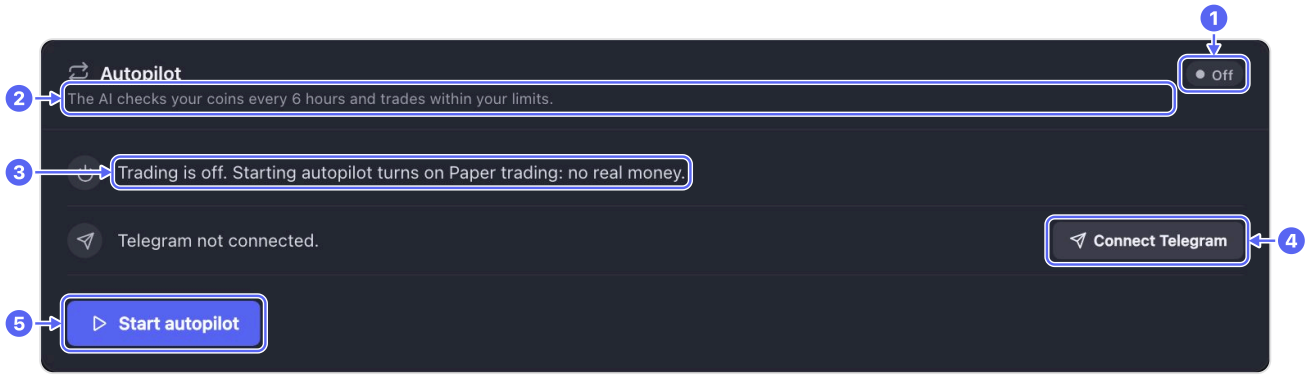
Paper trades on paper at Binance's live prices, with Binance's 0.1% fee on every buy and sell. It needs no exchange keys and no Binance account.

2 Turn on Paper

On the welcome card, press **Start**: Settings opens on the **Autopilot** card. While trading is off, its **Start autopilot** turns Paper on first, with no exchange keys to add, and the top bar shows **Paper**. You can also tap **Paper** on the **Trading mode** card.

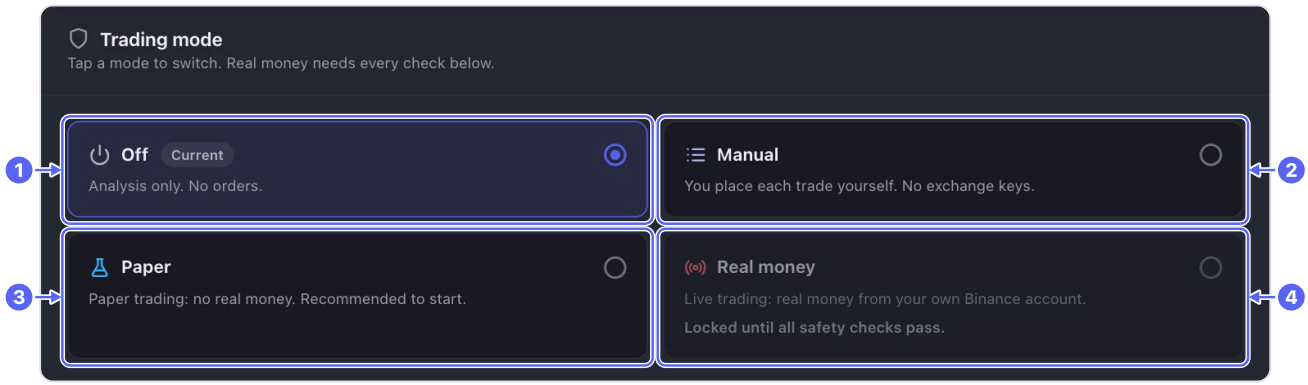
The welcome card after your first analysis.

#	NAME	WHAT IT DOES
1	**One step left: Start autopilot**	The welcome card’s step after your first analysis.
2	**Start**	Opens Settings on the Autopilot card.
3	**Hide**	Hides the welcome card.



Settings, Autopilot: trading is off, and Start turns Paper on.

#	NAME	WHAT IT DOES
1	**Status**	Off or On, like the autopilot badge in the top bar.
2	**Schedule**	How often the AI checks your coins: your Analysis interval, every 6 hours on a new account.
3	**Trading mode**	What its trades will be. While trading is off, Start autopilot turns Paper on first, never Real money.
4	**Connect Telegram**	Your one-time link, as on the Telegram alerts card. Telegram then tells you every trade.
5	**Start autopilot**	Turns Paper on first, with no exchange keys, then starts: the first check right away, then every 6 hours.



Settings, Trading mode.

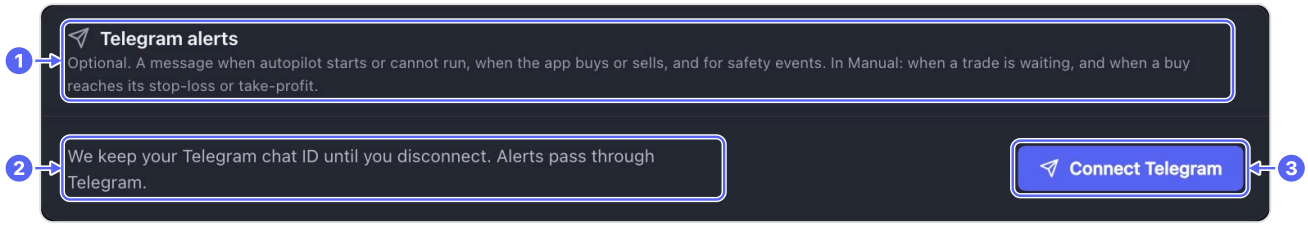
#	NAME	WHAT IT DOES
1	**Off**	Analysis only. No orders.
2	**Manual**	You place each trade yourself. No exchange keys (chapter 5).
3	**Paper**	Paper trading: no real money.
4	**Real money**	Live trading: real money from your own Binance account. Locked until all safety checks pass (chapter 4).

3 Start autopilot

From Off, that press also starts autopilot. In Paper or Manual mode, press **Start autopilot** on the Autopilot card. The first check runs right away, then every 6 hours. Your setup is done.

Telegram alerts (optional)

The **Telegram alerts** card in Settings sends you a message when something happens in your account.



Settings, Telegram alerts, before you connect.

#	NAME	WHAT IT DOES
1	**Telegram alerts**	Below Trading mode.
2	**What we keep**	Your Telegram chat ID, until you disconnect. Alerts pass through Telegram.
3	**Connect Telegram**	Makes your one-time link.

Telegram on your phone? Open ForecastsPro there and connect.

1. Press **Connect Telegram** for your link, then **Open Telegram**. It works once, for 10 minutes.
2. In Telegram, press **Start**. The card shows **Connected**.

You get an alert:

- **In Real money and Paper:** every buy, sell, stop-loss or take-profit that fills. With Real money also: the loss lock, a safety check that turns Real money off, or a stop-loss that may be missing.
- **In Manual mode:** when there are trades to place, at most once in 12 hours for the same trades.
- **In Manual mode also:** once when a buy you marked Done, and still hold, reaches its stop-loss or take-profit, so you can press **Sold** (chapter 5).
- **Autopilot:** once when you start it (not in Off), saying when its first check comes, and in every mode when it cannot run.

To stop, press **Disconnect**. A password change or reset also turns alerts off: connect again after it. An alert can fail to arrive: the app and your emails stay the record.

> **THE TELEGRAM BOT ONLY SENDS**
> It never asks for your password, your API keys or money, and it cannot trade.

Budget and risk (optional)

The **Strategy** card is last in Settings.

Settings, Strategy.

#	NAME	WHAT IT DOES
1	**Budget**	The most the bot may use at once.
2	**Risk level**	Low: fewer, surer trades. High: more trades, more risk (chapter 7).
3	**More settings**	Time horizon, Analysis interval, Stop-loss, Take-profit, AI model and Analysis depth, already set for you.
4	**Save strategy**	Saves your changes. Discard appears while something is unsaved.

A GOOD FIRST STRATEGY

- **Budget**: the amount you want to trade.
- **Risk level**: **Low** or **Medium**.
- **More settings**: leave them as they are. A new account has **Time horizon**: **Days**, with the **Analysis interval** at **360** (every 6 hours).

Then press **Save strategy**.

Time horizon and the automatic interval

Time horizon sets the candles the AI reads and, with your risk level, how far the stop-loss and take-profit sit: closer on Days, wider on Months. With the **Analysis interval** at **0**, it also sets how often autopilot runs:

HORIZON	STYLE	CANDLES READ	INTERVAL AT 0
Days	Swing	1h, confirmed on 4h	every 15 minutes
Weeks	Trend	4h, confirmed on 1d	every 60 minutes
Months	Long term	1d, confirmed on 1w	every 6 hours

Or type an interval in minutes, from 5 to 10,080 (7 days). Checking more often costs more AI usage: every 15 minutes, up to 24 times the AI cost of every 6 hours. Settings shows it as you type. **Use every 6 hours** sets every 6 hours (360 minutes) and saves it in one tap.

The AI model

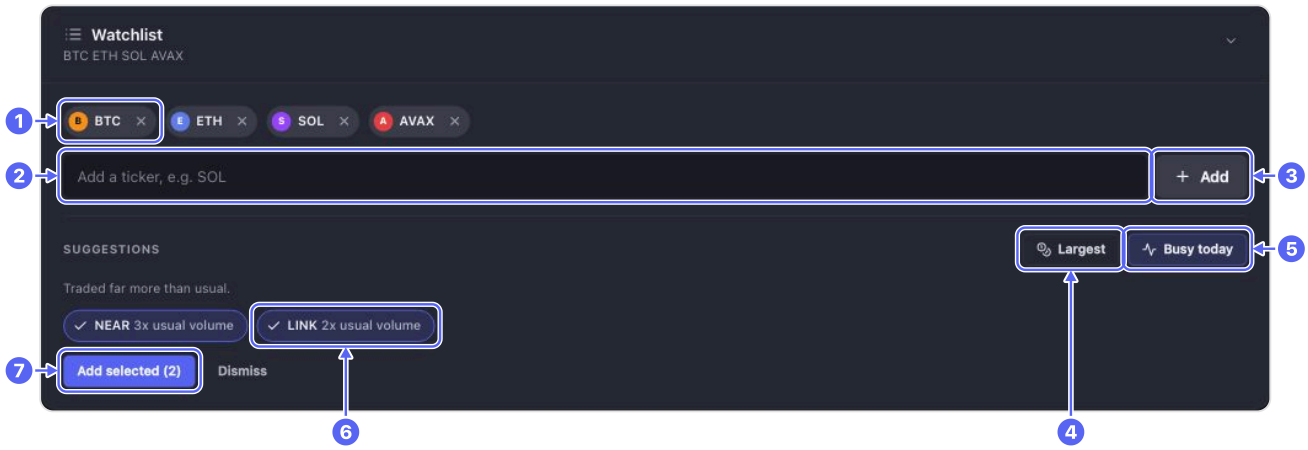
Under **More settings**, **AI model** starts on the most capable model. Want it faster or cheaper? With an Anthropic key, pick one of three:

- **Most capable**: the default, from about $18 a month.
- **Faster**: about $9 to $36 a month.
- **Cheapest**: about $4 to $18 a month.

An OpenAI key shows its own two models. A lower **Analysis depth** costs less too.

Your coins (optional)

A new account watches BTC, ETH and SOL. To change them, press **Edit** on the **Watchlist** card. Type a coin's short name, such as ADA, and press **Add**. Or press **Largest** or **Busy today** for ideas. Adding a coin trades nothing: the AI checks it at the next run. The coin must trade against USDT on Binance.



The Watchlist card, opened, with Busy today.

#	NAME	WHAT IT DOES
1	**Coin chip**	A coin on your watchlist. The × removes it.
2	**Add a ticker**	Type a ticker such as SOL.
3	**Add**	Adds the ticker you typed.
4	**Largest**	The biggest coins. Replace watchlist swaps your list for them.
5	**Busy today**	Up to 3 large coins that traded far more than usual on the last full day (UTC).
6	**Suggested coin**	Picked at first. Press it to leave it out.
7	**Add selected**	Adds the picked coins to your watchlist.

5 to 10 well-known coins are enough (30 at most). More coins cost more AI usage. Keep a coin while you hold it: once it is removed, the AI cannot sell it.

CHAPTER 04

Real money: automatic on Binance

Live trading: real money from your own Binance account. Automatic orders, within two limits you set.

Six steps. Then autopilot trades for you, within your limits.

BEFORE YOU START

Real-money trading, where available, may be restricted in your country (for example the EU/EEA, UK or US) because of local rules or Binance availability. The **Trading mode** card says if Real money is open for you. No Binance where you live? Use Manual mode (chapter 5). New to trading? We suggest a few weeks in Paper first.

1 Confirm your email, acknowledge the Risk Disclosure

Press **Confirm your email** in your receipt email. Then, on the **Risk disclosure** card of your Account page, read the document, tick the box and press **Acknowledge**.

2 Use a separate account

Open a separate Binance account or sub-account, with only the money you want to trade. Never your main account or your savings.

3 Create a trade-only Binance key

Open **Exchange keys** on the **API keys** card and copy our server IP address. On Binance, in API Management for that account, create a key with these permissions:

TURN ON

- **Enable Spot & Margin Trading** (reading is on by default)
- **Restrict access to trusted IPs only**, with our server IP address

LEAVE OFF

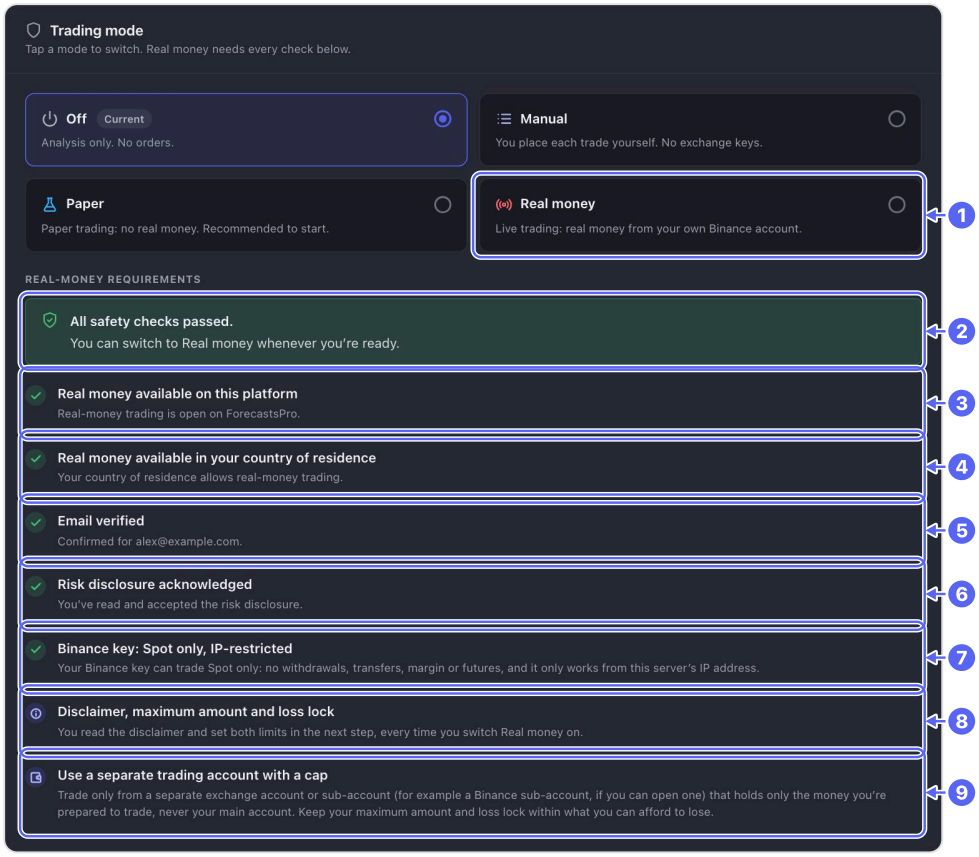
- Withdrawals
- Internal and universal transfers
- Margin loans
- Futures, options and portfolio margin

4 Save the new keys

Paste the key and its secret into **Binance API key** and **Binance API secret**, and press **Save keys**. On the **Trading mode** card, **Binance key: Spot only, IP-restricted** then shows a green check. If not, it says what to fix.

5 Switch Real money on

With every safety check green, tap **Real money**. Read the disclaimer, type a small **Maximum real-money amount** and a **Loss lock** you can accept, tick the box and press **Switch Real money on**.



All safety checks passed.

#	NAME	WHAT IT DOES
1	**Real money**	Tap it to open the Real-money dialog (step 5).
2	**All safety checks passed**	You can switch to Real money whenever you're ready.
3	**Platform**	Real money is open on ForecastsPro.
4	**Country**	Your country of residence allows it.
5	**Email verified**	Step 1.
6	**Risk disclosure acknowledged**	Step 1.
7	**Binance key: Spot only, IP-restricted**	Steps 3 and 4: no withdrawals, and only from our server IP address.
8	**Disclaimer, maximum amount and loss lock**	Asked every time you switch Real money on (step 5).
9	**Use a separate trading account with a cap**	Recommended, not checked (step 2).

The Real-money dialog.

#	NAME	WHAT IT DOES
1	**Disclaimer**	Read it to the end. It has a version number.
2	**Loss count**	Your loss is counted from the moment you switch on.
3	**Maximum real-money amount**	The most the app may have at work at one time. Your budget still applies, and the lower one wins.
4	**Loss lock**	When your loss reaches it, all trading stops. Nothing is sold. $100 suggested.
5	**Separate account**	Keep both limits within what you can afford to lose.
6	**Accept**	Tick to accept the disclaimer.
7	**Switch Real money on**	Switches Real money on. The app checks everything again first.

Autopilot already running? Its next run can then place real orders without asking you: stop it first if you do not want that.

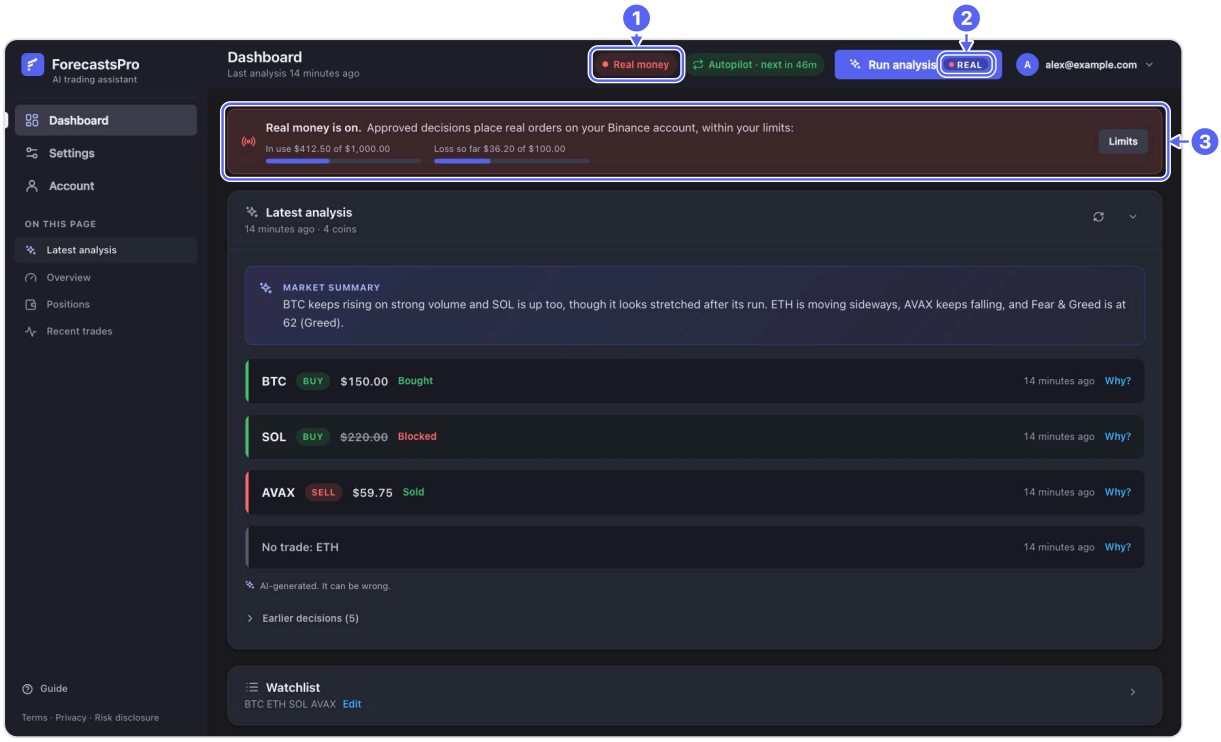
Keep the risk level at Low or Medium. Raise your limits only after weeks of results you understand, never to recover a loss.

6 Start autopilot

Press **Start autopilot** on the Autopilot card, then **Start autopilot** again to confirm. The first check runs right away.

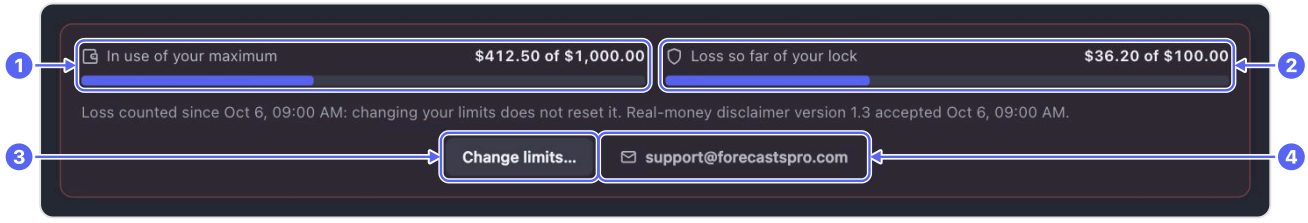
While Real money is on

- Every **Run analysis** asks you to confirm first (**Run with real money**), and so does **Start autopilot**.
- Your loss count starts when you first switch Real money on. New limits, or switching off and on again, do not reset it.
- Tap **Off** at any time: no new orders, and nothing is sold.
- To go back to Paper, tap **Paper**: no keys to paste, and your Binance key stays saved for next time. Your real positions stay on Binance with their orders, and the app no longer watches them: watch them on Binance yourself.



Real money on: a red mode badge, the Real tag and a banner on every page.

#	NAME	WHAT IT DOES
1	**Real money**	The mode badge turns red while Real money is on.
2	**Real tag**	An analysis you start places real orders. The app asks you to confirm first.
3	**Real-money banner**	On every page: the amount at work and the loss so far against your limits.



Your limits on the Trading mode card.

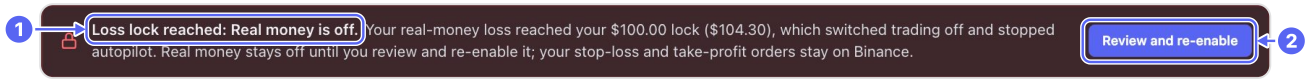
#	NAME	WHAT IT DOES
1	**In use of your maximum**	Money at work against your maximum amount.
2	**Loss so far of your lock**	Your real-money loss against your loss lock.
3	**Change limits**	New limits. The loss keeps counting from the same moment.
4	**Support**	Questions? Write to us.

If Real money switches off by itself

The app switches Real money to **Off** when your key or your country fails a safety check, for example when a permission is added to your key: the Trading mode card says why, and we email you (Telegram too, if connected). Saving or removing Binance keys switches it off too. Nothing is sold, and autopilot only analyzes. Fix the cause, then turn Real money on again.

Support can also switch your trading off, and autopilot with it. The Trading mode card then says so, and we email you. Write to support to have Real money allowed again.

If the loss lock is reached



The loss lock banner.

#	NAME	WHAT IT DOES
1	**Loss lock reached**	Trading and autopilot were switched off. Nothing is sold: your positions and their orders stay on Binance.
2	**Review and re-enable**	Only if you decide to: new limits, the disclaimer again and a new loss count.

All trading and autopilot stop. Nothing is sold, so the loss can still grow on Binance. We email you (Telegram too, if connected). Read your decision journal before you press **Review and re-enable**.

CHAPTER 05

Manual mode: by hand on any exchange

The AI gives you each trade. You place it yourself on any exchange and press Done. No exchange keys.

The risk gate works as in every mode.

Switch to Manual mode

On the **Trading mode** card in Settings, tap **Manual**. Keep on your watchlist only coins your exchange also lists. Then connect Telegram, so you know when a trade waits, and start autopilot with an interval that leaves you time to place each trade (chapter 3).

A trade to place

After an analysis, each approved buy or sell has a box under its line: **Place this on your exchange**. A banner counts the waiting trades, for example "2 trades to place."

Latest analysis in Manual mode: two trades to place, one expired, one done.

#	NAME	WHAT IT DOES
A	**Place this on your exchange**	A trade the risk gate approved. You place it by hand.
B	**The trade**	The amount, about how many coins, the price, and the stop-loss and take-profit to set after a buy.
C	**Done**	Press it after you placed the order (step 4 below).
D	**Skip**	You are not placing this one. No trade is recorded.
E	**Before a sell**	Cancel that coin's stop-loss and take-profit on your exchange first.
F	**Expired**	No longer waiting. If you placed it after all, press I placed it.
G	**Done by you**	A trade you confirmed.

Place it in 4 steps

1. For a sell, first cancel that coin's stop-loss and take-profit on your exchange.
2. Place it on your exchange as a market order (at the price now), for the amount in the box.
3. After a buy, set a stop-loss and a take-profit on your exchange, at the two prices in the box.
4. Press **Done**, then type the quantity and the price your exchange shows. Not in US dollars? Keep the price already in the field.

A buy under $10 is blocked as too small. A sell has no minimum.

When a level is reached

The app cannot see your exchange: when your stop-loss or take-profit fills there, press **Sold** on that position, type the quantity and the price your exchange shows, and press **Save**.

With Telegram alerts on, the app tells you once, within about an hour, when a buy you marked Done, and still hold, reaches either level. The alert's button opens your positions.

The buttons

BUTTON	WHAT IT DOES
I placed it	On a Skipped or Expired trade that you placed after all, while it is still listed. It opens the same form as Done.
Sold	On each position. It confirms a sale the app cannot see: a stop-loss or take-profit that filled, or your own sale.
Undo	In the message after Done or Sold, for 30 seconds. It takes that entry back. Later, to take back a buy, press **Sold** and type the same price.

Your positions and trades

A buy you confirm becomes a position on the **Positions** card, which reads **From the trades you confirmed**. **Recent trades** lists them too. Manual mode keeps its own figures.

How each buy ended

For 60 days, the app follows each buy idea on Binance's price and shows which came first, its stop-loss or its take-profit, for example "Skipped · Stop-loss reached". A line above **Earlier decisions** counts how your last 20 ended. Prices on your exchange can differ.

When a trade expires

A waiting trade expires at the next analysis, when you confirm another trade for the same coin, or when you leave Manual mode (with trades waiting, the app asks first: **Leave Manual**). A waiting buy can also expire when you confirm a trade for another coin. Placed it after all? Press **I placed it**.

WHAT THE APP CANNOT SEE

- The app never places, checks or cancels an order on your exchange, and shows no balances.
- Your caps and the kill switch count only the trades you confirm, and fees only if you include them in what you type.
- You can confirm a buy up to 110% of the amount in its box: more stays outside the app's figures.

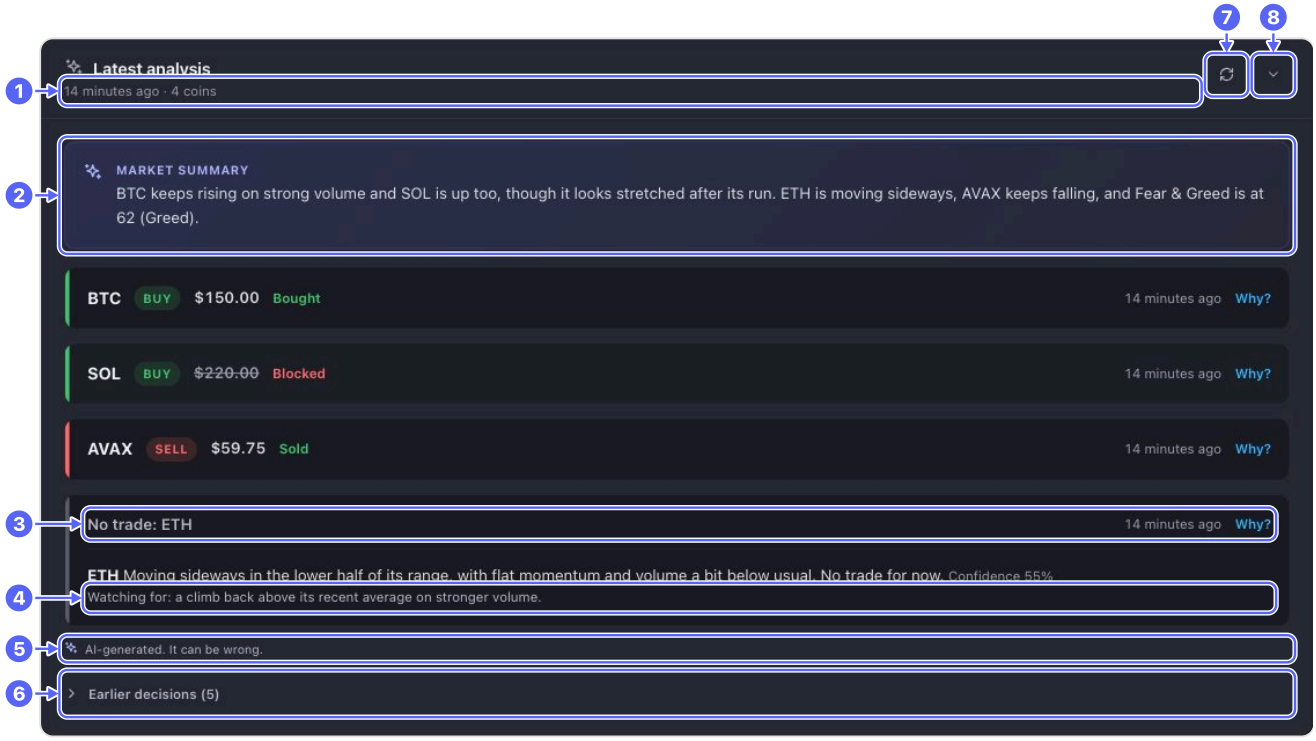
CHAPTER 06

Read your results

Read each result, run autopilot and check your positions.

Latest analysis

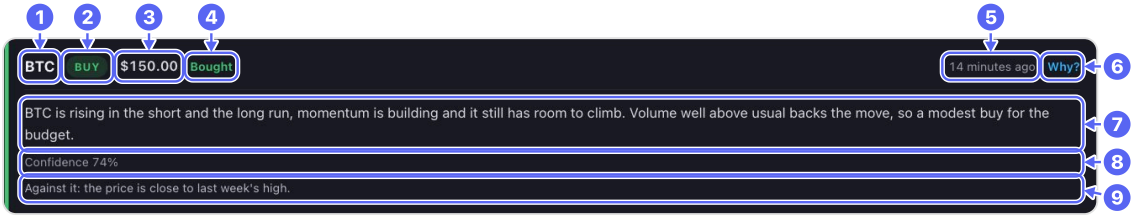
The **Latest analysis** card shows your newest analysis: a line for each buy or sell, and one for the coins with no trade.



Latest analysis: a buy, a blocked buy, a sell, and the No trade line with its Why? open.

#	NAME	WHAT IT DOES
1	**Last analysis**	When it ran, and how many coins it covered.
2	**Market summary**	The AI's short read of the market in this analysis.
3	**No trade**	The coins the AI holds, in one line. Why? gives each reason.
4	**Watching for**	What would change the AI's mind about this coin.
5	**AI label**	Every analysis is AI-generated and can be wrong.
6	**Earlier decisions**	The analyses before this one: your decision journal. Press to open.
7	**Refresh**	Loads the newest decisions.
8	**Fold**	Folds the card.

Here is one line, with **Why?** open.



One result line, with Why? open.

#	NAME	WHAT IT DOES
1	**Coin**	One line for each buy or sell.
2	**Action**	Buy or sell. Holds share one line: No trade.
3	**Amount**	How much the order is for, in USDT.
4	**Bought**	What happened to the order (the table below lists the words).
5	**Time**	When the analysis ran.
6	**Why?**	Opens the reasoning and the confidence.
7	**Reasoning**	Why the AI proposes this, in plain words.
8	**Confidence**	How sure the AI is, from 0 to 100%.
9	**Against it**	The AI's strongest reason not to buy.

Buy, sell or hold

BUY opens or adds to a position. SELL sells all or part of one. HOLD means no trade now: on Latest analysis these coins share one line, "No trade".

The word on the line

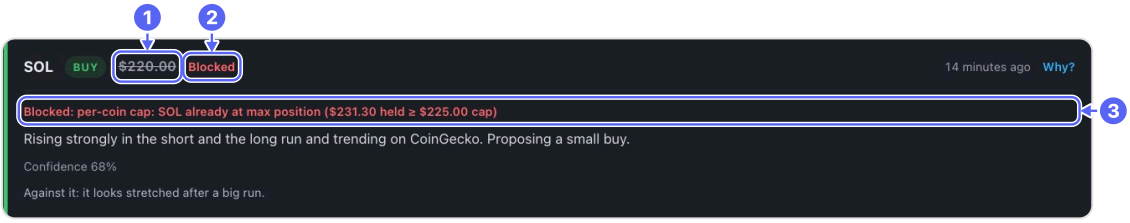
YOU SEE	WHAT IT MEANS
Bought, Sold	The order filled.
Not bought, Not sold	Approved, but not filled: trading is off, autopilot was stopped, or the order did not go through.
Blocked	The risk gate stopped it, or in Manual mode, autopilot was stopped. No order is placed.
Failed, Not placed, Not filled, Partly filled, Not confirmed	The order had a problem. **Why?** says what, in plain words.
No stop-loss	The buy filled, but its stop-loss may be missing (red box below).
Done by you, Skipped, Expired	A trade in Manual mode. A past buy can add "Take-profit reached" or "Stop-loss reached".

Why?

Why? gives the AI's reasons and its confidence. For a blocked or trimmed order, the gate's reason comes first. For a buy, it usually ends with "Against it: ...", the AI's strongest reason not to buy. For a coin with no trade, it usually ends with "Watching for: ...", what would change the AI's mind.

What the risk gate says

YOU SEE	WHAT IT MEANS
Trimmed by the risk gate to $... (per-coin cap).	Made smaller to fit a cap, then approved.
Blocked: per-coin cap ...	The coin already has its full share of your budget.
Blocked: total budget cap ...	Your whole budget is already at work.
Blocked: real-money maximum ...	Real money only: your maximum amount is already at work.
Blocked: confidence ... is under the ... minimum	The AI was not sure enough for your risk level (70% on Low, 60% on Medium, 60% on High).
Blocked: daily loss ... exceeds limit	The kill switch paused new buys. Sells still work.
Blocked: no ... position to sell	There is no position in this coin to sell.
Blocked: an earlier ... order's outcome is not confirmed ...	Binance has not confirmed an earlier order for this coin. No new order for it until it does.

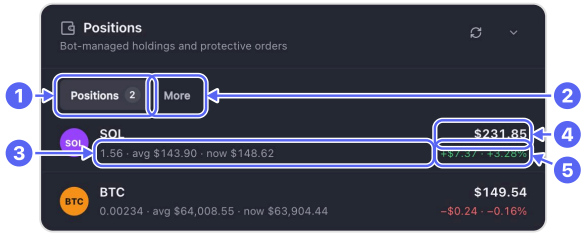


A blocked buy: the per-coin cap was already reached.

#	NAME	WHAT IT DOES
1	**Amount crossed out**	Nothing was ordered.
2	**Blocked**	The risk gate stopped it.
3	**The gate's reason**	The rule that blocked it, in the gate's words.

Positions and trades

The **Positions** card has two tabs, **Positions** and **More**. In Manual mode it shows the positions from the trades you confirmed, each with a **Sold** button.



Positions.

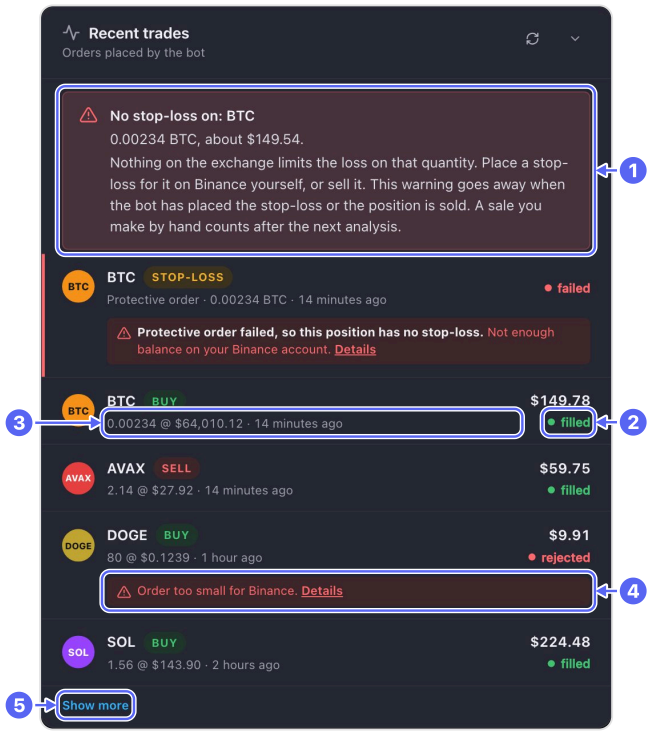
#	NAME	WHAT IT DOES
1	**Positions**	Coins the app bought and still holds, with how many.
2	**More**	Each position's stop-loss and take-profit. In Real money, your Binance balances too.
3	**Quantity and prices**	Amount held, average cost and the price now.
4	**Value**	What the position is worth now.
5	**Unrealized P&L**	Gain or loss if you sold now, in dollars and percent.

More: each position's stop-loss and take-profit.

#	NAME	WHAT IT DOES
1	**Open orders**	Each position's stop-loss and take-profit: on paper in Paper, on Binance in Real money.
2	**Pair and side**	The coin pair and whether the order sells or buys.
3	**Order type**	Stop-loss or Take-profit, and the quantity.
4	**Trigger price**	The price at which the order triggers.

Recent trades

The orders the app placed, newest first. A refused order says why in plain words, for example "Order too small for Binance." A sale by your stop-loss or take-profit says so, for example "sold by your stop-loss". Coins sold or moved outside the app in Real money show "left the bot" and leave your positions.



Recent trades in Real money, with the red No stop-loss warning.

#	NAME	WHAT IT DOES
1	**No stop-loss warning**	A position may have no stop-loss. The box below says whether you need to act.
2	**Status**	What happened to the order: filled, rejected, failed or skipped.
3	**Quantity and price**	How much, at what price, and when.
4	**Why it was refused**	In plain words. Details shows Binance's own words.
5	**Show more**	The next rows, up to 25.

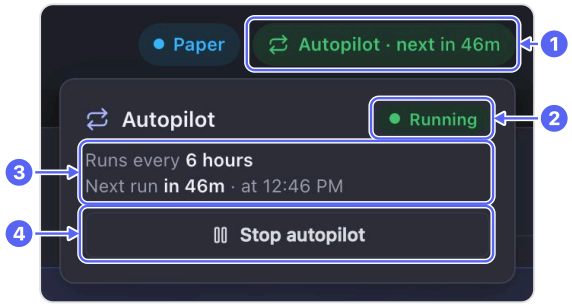
IF YOU SEE A RED "NO STOP-LOSS" BOX

A position may have no stop-loss. In Paper, there is nothing to do: the app tries again every 5 minutes. In Real money, while trading is on, the app keeps trying to place it. If the box stays, place a stop-loss on Binance yourself for the quantity in the box, or sell it: the box goes once the app's own stop-loss is placed or the position is sold. If Binance does not trade the coin right now, the box says so: to sell it, move it to an exchange that trades it, if Binance lets you. In Real money we also email you, and Telegram too if connected.

Autopilot

Autopilot checks your coins by itself: right away when you start it, then every 6 hours on a new account. Start or stop it on the **Autopilot** card in Settings, or with the autopilot badge in the top bar. Stopping closes nothing. A check already running finishes without new trades.

- **Real money: Start autopilot** asks you to confirm first.
- **Trading off:** the card's **Start autopilot** turns Paper on first. From the top bar, it leaves trading off: autopilot then only analyzes, and its first check comes one interval later.
- **The first check waits one interval** while an analysis runs, after one in the same mode in the last 15 minutes, or while a trade waits in Manual mode.



The autopilot controls, opened from the top bar.

#	NAME	WHAT IT DOES
1	**Autopilot badge**	Press it to open or close these controls.
2	**Status**	Running or Off.
3	**Schedule**	Your analysis interval, and when the next analysis is due.
4	**Start / Stop autopilot**	Starts or stops the scheduled analyses.

If an autopilot run fails, the badge turns amber: press it to see why, often with a button that fixes it. The Autopilot card in Settings says it too. If autopilot cannot run, for example when your AI account has no credit, we tell you what to do, at most once a day for the same reason: on Telegram if you connected it, otherwise by email.

To check your coins now, press **Run analysis** at the top right. It can take a few minutes, and a message then gives its rough cost, for example about $0.13.

CHAPTER 07

Your money, your limits

Your money stays in your own account. Your limits are written in code.
Nothing trades until you choose a mode.

Your money stays in your own account

ForecastsPro never holds your money, in any mode.

Real money uses a trade-only Binance key, locked to our server's IP address (chapter 4). The app refuses a key that can withdraw or move money, and checks it again before every real order.

Saved keys are encrypted and never shown again. You can remove one on the **API keys** card at any time.

Paper needs no exchange key: it trades on paper at Binance's live prices.

Manual mode needs no exchange keys: the app places no order and reads no balance.

Off, the loss lock, a failed safety check or an ended access: the app sells nothing. In Real money, your positions and their stop-loss and take-profit orders stay on Binance. In Paper, each position keeps its stop-loss and take-profit on paper, and they still sell when reached.

A risk gate the AI cannot change

In every mode, each decision passes these rules:

- **Watchlist only.** A coin that is not on your watchlist is blocked.
- **Minimum confidence.** A decision under the minimum confidence of your risk level is blocked.
- **Per-coin cap.** No coin takes more than its share of your budget.
- **Total budget cap.** All positions together stay within your budget.
- **Sells only its own buys.** What the app bought or, in Manual mode, what you confirmed. Coins you already held are never sold or counted.

A buy too large for a cap is made smaller. With no room left, it is blocked.

The three risk levels

RULE	LOW	MEDIUM	HIGH
Per-coin cap (share of budget)	5%	15%	30%
Daily-loss limit (share of budget)	2%	5%	10%
Minimum confidence	70%	60%	60%
Stop-loss on Days	1.2%	2%	4%
Take-profit on Days	2.4%	4%	8%
Stop-loss on Weeks	3%	5%	10%
Take-profit on Weeks	6%	10%	20%
Stop-loss on Months	6%	10%	20%

RULE	LOW	MEDIUM	HIGH
Take-profit on Months	12%	20%	40%

You pick a level, not each rule. Stop-loss and take-profit are a share of the price paid and follow your time horizon. The table shows the widest: a calmer coin gets closer ones. You can set your own under **More settings**.

On Low the AI acts only on clear chances. On High it also acts on smaller, less certain ones and on earlier moves, before the bigger trend turns up: more trades, more risk.

The daily-loss kill switch

When the trades closed in the last 24 hours have lost more than your daily-loss limit, the kill switch pauses **new buys** until the loss is back under it. Sells, stop-loss and take-profit orders still go through.

A stop-loss and take-profit after every buy

In Real money, every buy gets a stop-loss and a take-profit on Binance: the take-profit sells after a rise, the stop-loss after a fall. When one sells, Binance cancels the other. If Binance refuses them, the app tries again and warns you in red (chapter 6).

In Paper, the app sets the same two levels and sells at the first one Binance's live price reaches. It checks every 5 minutes, also after you switch Paper off.

In Manual mode, each buy comes with both prices: you set them on your exchange (chapter 5).

Real money stays locked until the safety checks pass

Real money switches on only when every safety check on the **Trading mode** card has passed. Each time you switch it on, you set two limits: a maximum amount and a loss lock (chapter 4).

Everything is recorded

Your decision journal keeps every decision, in every mode, with its reasoning and the gate's verdict. You can download all of it.

> **WHAT SAFETY CANNOT DO**
>
> The limits lower risk. They do not remove it. The budget limits the money at work at one time, not your total loss. A stop-loss does not guarantee the price, and in a fast market it may not sell at all. An exchange can be down or refuse an order. You can lose money.

CHAPTER 08

Good habits

Six habits that keep you in control.

Start small

New to trading? Give Paper a few weeks first, and trade for real once Paper no longer surprises you. In Real money, keep your limits small and raise them only after weeks of results you understand, never to recover a loss.

Read the decision journal

Press **Why?** and open **Earlier decisions** often, above all for blocked buys and trades that lost.

Change one setting at a time

Then wait several analyses before you judge it.

Let the risk gate work

A blocked decision is the gate at work. Keep your limits steady, and never raise your risk level after a bad week.

Check your stop-loss orders

In Real money and Paper, every position needs its stop-loss and take-profit: see **More** on the Positions card. A red **No stop-loss** box in Real money? Act at once (chapter 6). In Manual mode, check them on your exchange.

Protect your accounts

Use a strong password that you use nowhere else, and two-step sign-in at your exchange. Never share your password or your keys: we never ask for them. If a key may have leaked, delete it where you created it and save a new one.

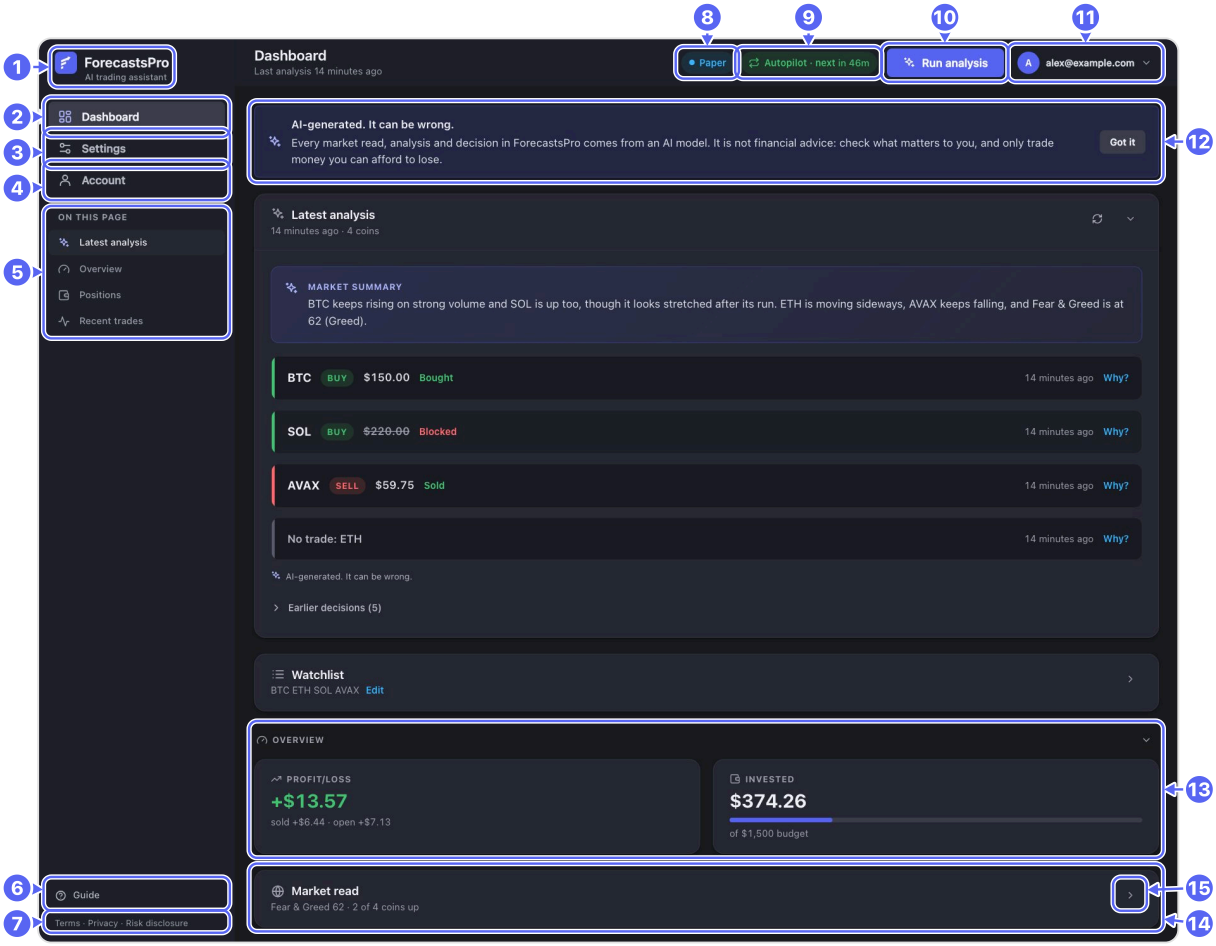
CHAPTER 09

Every screen and button

Every screen and button, numbered on its picture.

The app frame

The sidebar and the top bar are on every page. Settings has five cards: Autopilot, API keys, Trading mode, Telegram alerts and Strategy.

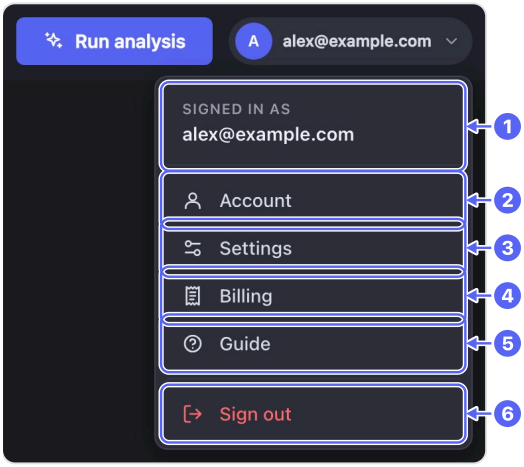


The dashboard.

#	NAME	WHAT IT DOES
1	**Logo**	Back to the dashboard from anywhere.
2	**Dashboard**	Market read, decisions, positions and trades.
3	**Settings**	Everything you set up, in five cards.
4	**Account**	Profile, subscription, risk disclosure, password and your data.
5	**On this page**	Takes you to a card of this page and opens it when it is folded.
6	**Guide**	This guide, in a new tab.
7	**Legal**	Terms, Privacy Policy and Risk Disclosure.

#	NAME	WHAT IT DOES
8	**Mode badge**	Your mode. Press it to open Trading mode in Settings.
9	**Autopilot badge**	Time to the next analysis. Press it for the controls.
10	**Run analysis**	Analyzes your whole watchlist now.
11	**Account menu**	Account, Settings, Billing, this guide and Sign out.
12	**AI notice**	Once per session. Got it closes it.
13	**Overview**	Your two figures, for the mode you are in.
14	**Market read**	Folded as it starts: the mood in one line.
15	**Fold**	Every card has this arrow. It folds or opens the card.

The account menu



The account menu, under your email address at the top right.

#	NAME	WHAT IT DOES
1	**Signed in as**	The account you are using.
2	**Account**	Profile, subscription and security.
3	**Settings**	Autopilot, keys, mode, Telegram alerts and strategy.
4	**Billing**	Your access, renewal and receipts.
5	**Guide**	Opens this guide in a new tab.
6	**Sign out**	Ends this session on this device.

The dashboard, card by card

From the top: the welcome card, Latest analysis, Watchlist, Overview, Market read, Positions, Recent trades, Charts and Research feed. A new account sees fewer cards: the rest appear after its first result.

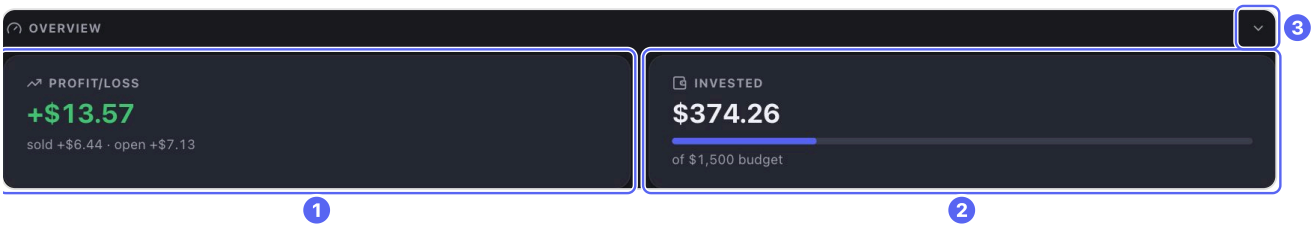
Fold a card

Market read, Watchlist, Charts and Research feed start folded. A card you open stays open on that browser.

The Overview folded, and Market read as it starts.

#	NAME	WHAT IT DOES
1	**Overview, folded**	Both figures stay: Profit/loss and Invested.
2	**Open**	Opens it again. Pressing anywhere on the bar does the same.
3	**Market read, folded**	As it starts: its title and the mood in one line.

Overview: your two figures

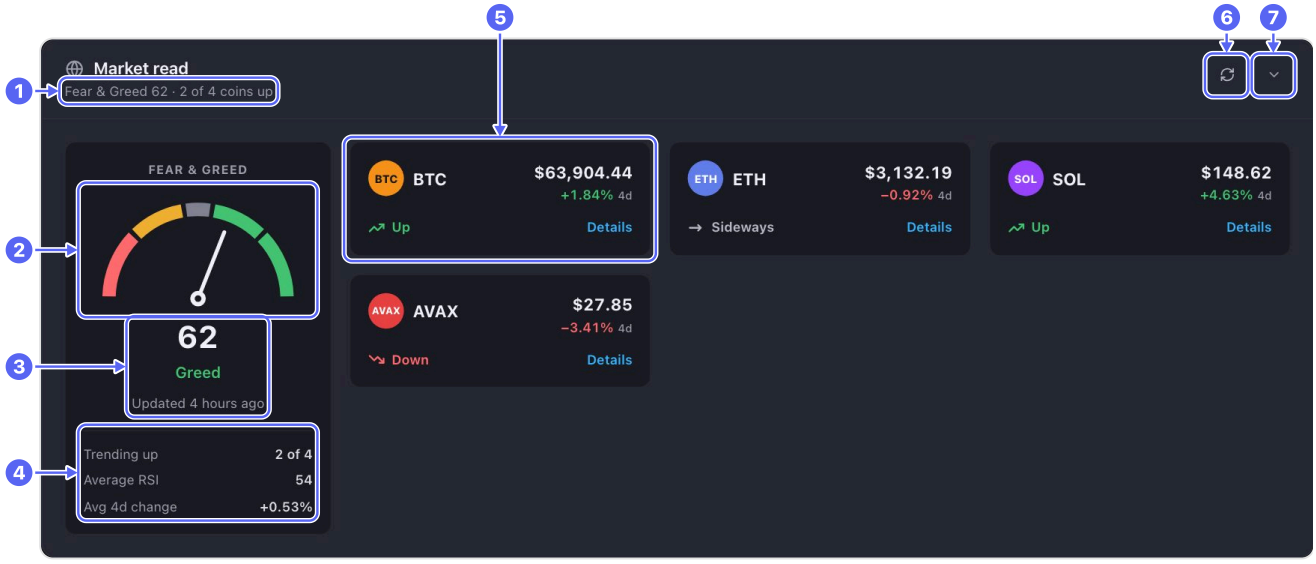


The Overview.

#	NAME	WHAT IT DOES
1	**Profit/loss**	What your trades made or lost: sold, and still open.
2	**Invested**	Money at work, against your budget.
3	**Fold**	Folds the Overview into one line that keeps both figures.

Both figures count only the app's trades, or in Manual mode the trades you confirmed. Each mode keeps its own figures. In Off you see Real money or Paper, whichever you used last.

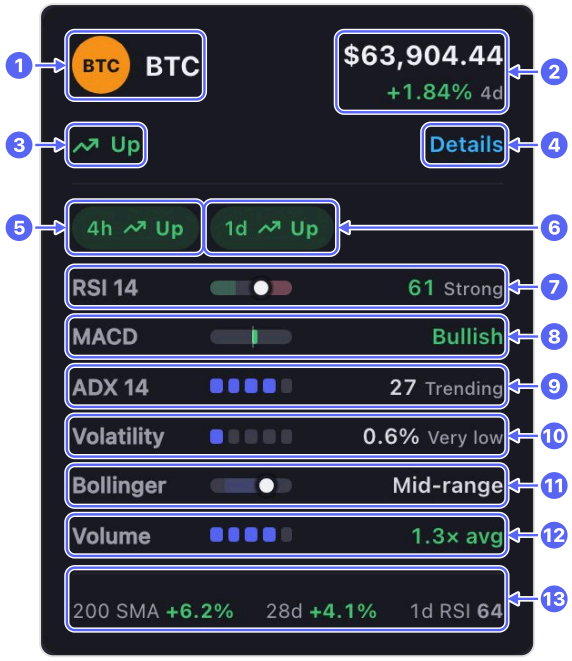
Market read



Market read, opened: the Fear & Greed gauge and one card for each coin.

#	NAME	WHAT IT DOES
1	**Mood line**	Fear & Greed and how many coins trend up: what the folded card shows.
2	**Fear & Greed**	Crypto crowd mood: 0 extreme fear, 100 extreme greed.
3	**Reading**	Today's value, its label and when it was updated.
4	**Watchlist mood**	Coins trending up, average RSI and average change.
5	**Coin card**	One per watchlist coin: price, change and trend. Details opens its numbers.
6	**Refresh**	Reloads market data now.
7	**Fold**	Folds the card.

Green is strong or up, red is weak or down. Amber is a stretched or very large move, or fear on the Fear & Greed gauge. Chapter 10 explains the numbers under **Details**.



One coin card, with Details open.

#	NAME	WHAT IT DOES
1	**The coin**	Its logo and ticker.
2	**Price and change**	The price now, and its change over the last 24 candles.
3	**Trend**	Up, Sideways or Down.
4	**Details**	Opens or closes the numbers below.
5	**Trading timeframe**	The trend on the candles the AI trades on.
6	**Higher timeframe**	The trend on the next timeframe up.
7	**RSI 14**	Momentum, 0 to 100.
8	**MACD**	Momentum direction: Bullish or Bearish.
9	**ADX 14**	Trend strength: Trending or Ranging.
10	**Volatility**	Average candle size (ATR) as % of price.
11	**Bollinger**	Where the price sits in its bands.
12	**Volume**	Recent volume against its average.
13	**Context**	Distance from the 200 SMA, the price change over a longer period and the higher timeframe's RSI.

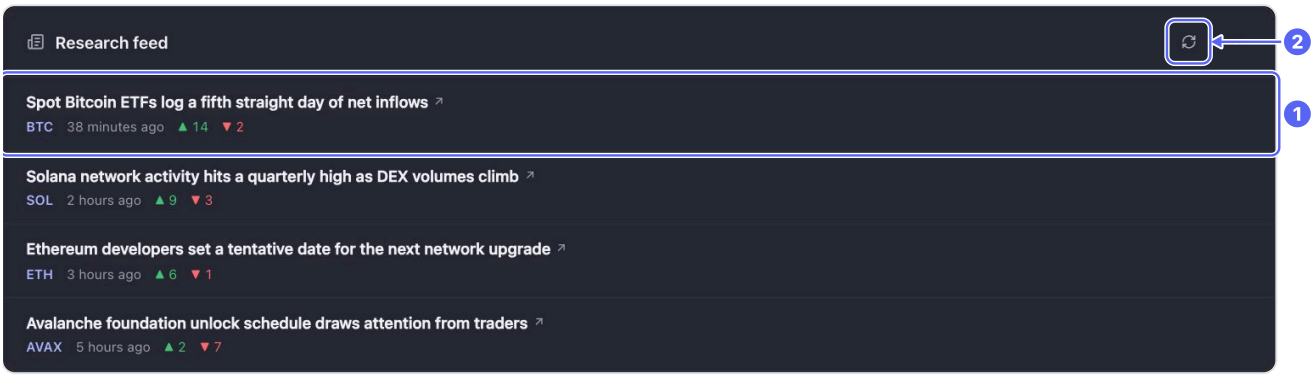
Charts

A TradingView chart for each coin on your watchlist. It loads when you open the card.

#	NAME	WHAT IT DOES
1	**Coin tabs**	One tab per watchlist coin.
2	**Chart**	Candles sized to your horizon.

Research feed

It shows once you save a news key on the API keys card, under **More sources (optional)**.



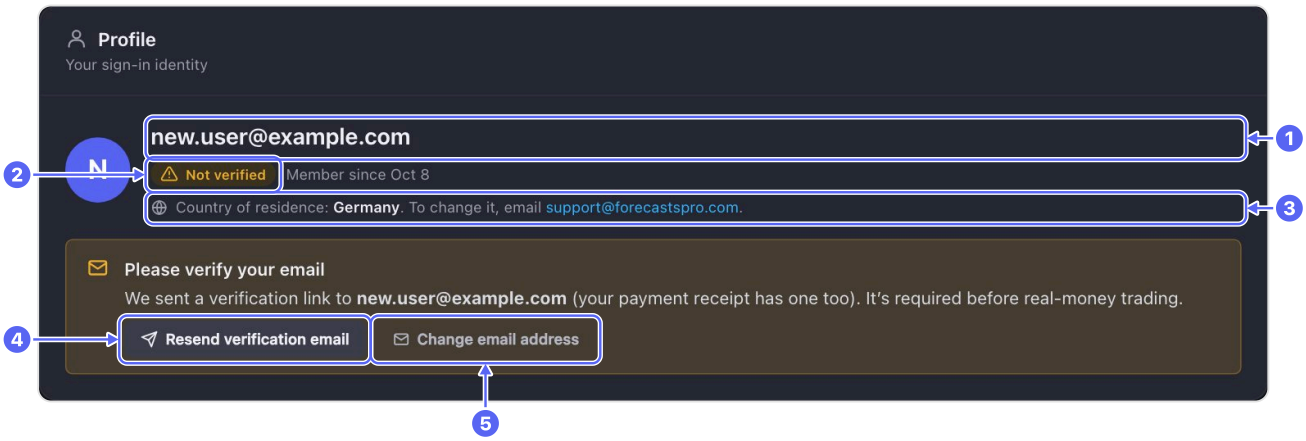
The Research feed: news the AI reads in each analysis.

#	NAME	WHAT IT DOES
1	**Headline**	News for your coins, from your CryptoPanic token.
2	**Refresh**	Loads the newest headlines.

Your Account page

Open **Account** in the sidebar. A red **!** next to it means your email is not confirmed, or a new Risk Disclosure waits for you.

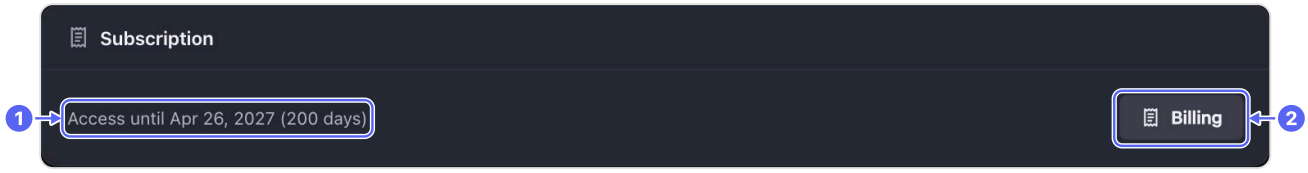
Profile



Profile, before the email address is confirmed.

#	NAME	WHAT IT DOES
1	**Your email**	The address you sign in with.
2	**Verification**	Email verified or Not verified.
3	**Country of residence**	To change it, email support.
4	**Resend verification email**	Sends the confirmation link again.
5	**Change email address**	Fixes a typo in the first 48 hours, while unconfirmed.

Subscription

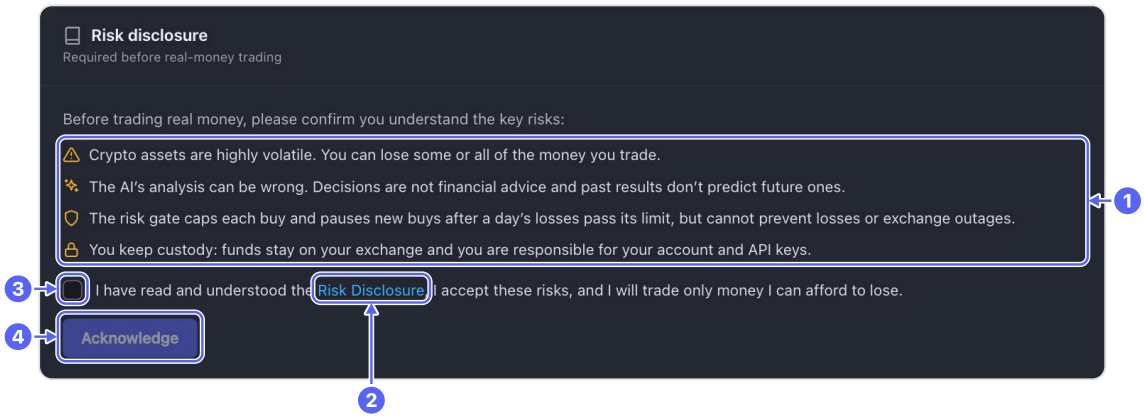


Subscription: your access in one line.

#	NAME	WHAT IT DOES
1	**Your access**	Until when, and how many days are left.
2	**Billing**	Your orders and receipts. Near the end of your access it reads Renew.

Risk disclosure

Real money needs this acknowledgement (chapter 4).

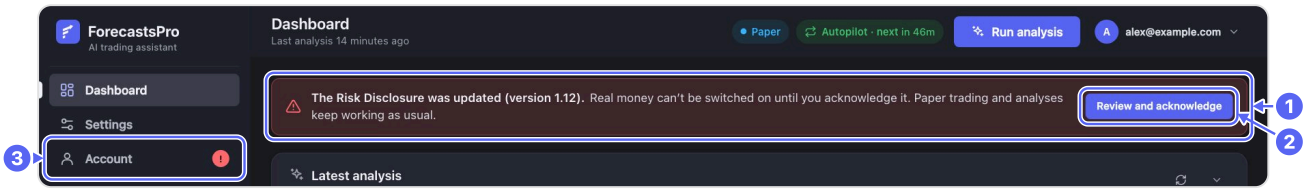


Risk disclosure, not yet acknowledged.

#	NAME	WHAT IT DOES
1	**Key risks**	The four things to understand before you switch to Real money.
2	**Risk Disclosure**	Opens the full document.
3	**Acknowledgement box**	Tick it once you have read and accepted the risks.
4	**Acknowledge**	Records your acknowledgement and the version you accepted.

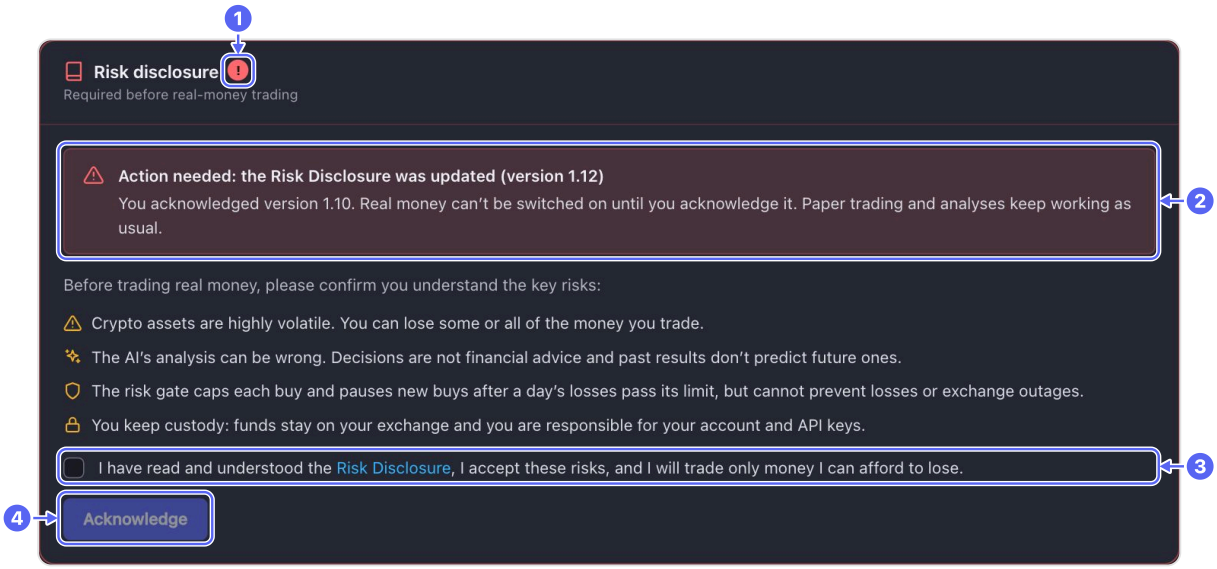
A new version of the Risk Disclosure

After a new version, you cannot turn Real money on until you acknowledge it. If it is on already, it keeps running. Press **Review and acknowledge** in the red banner, read the new version, tick the box and press **Acknowledge**.



The red banner and the red ! after a new version.

#	NAME	WHAT IT DOES
1	**Red banner**	On every page until you acknowledge the new version.
2	**Review and acknowledge**	Opens the Risk disclosure card on your Account page.
3	**Account !**	The red ! shows which page needs you.



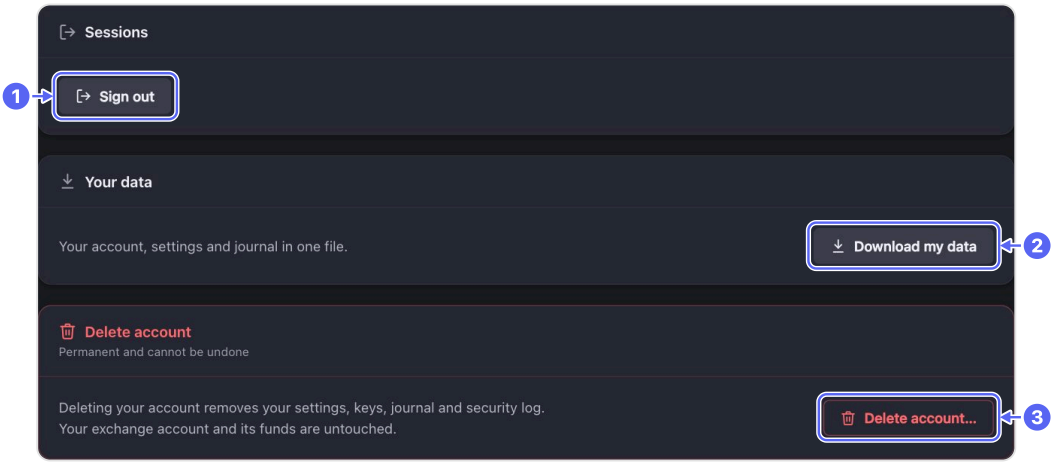
The Risk disclosure card, asking for the new version.

#	NAME	WHAT IT DOES
1	**Red ! by the title**	A new version of the Risk Disclosure is waiting for you.
2	**What changed**	The new version, the one you accepted before, and what is limited until you acknowledge.
3	**Read and tick**	The link to the new version, and the box to tick.
4	**Acknowledge**	Records the new version on your account.

Password, sessions, your data and deleting your account

Change password, opened.

#	NAME	WHAT IT DOES
1	**Current password**	Proves it is you.
2	**New password**	The meter under it shows how strong it is.
3	**Confirm new password**	Type the new password again.
4	**Update password**	Saves it, signs out every other session and turns Telegram alerts off.



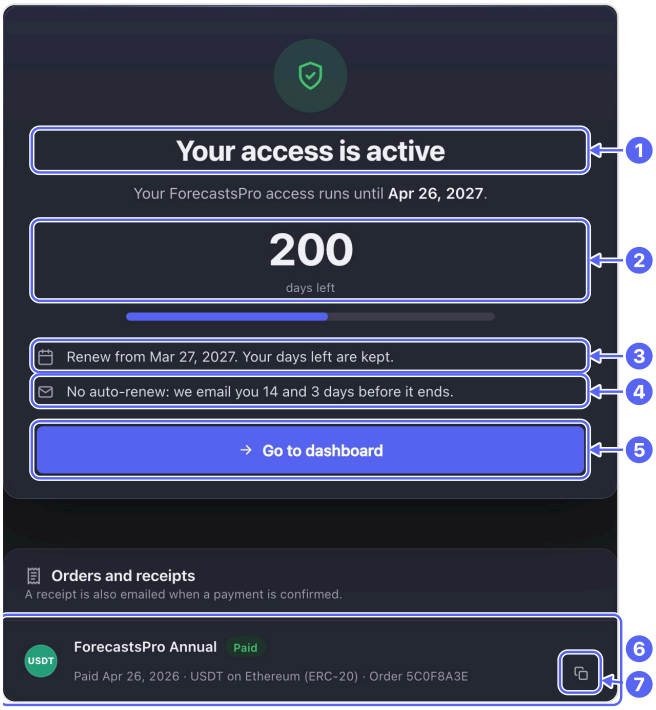
Sessions, Your data and Delete account.

#	NAME	WHAT IT DOES
1	**Sign out**	Ends the session on this device.
2	**Download my data**	One file: your account, settings (never your keys), journal, orders and any Telegram chat ID.
3	**Delete account**	Permanent. The app asks for your password first.

Deleting your account permanently removes your settings, your keys, your decision journal and your security log. It also ends your access. Your exchange account and its money are not touched. Orders already on Binance stay there.

Billing and renewal

Open **Billing** in the account menu. Near the end of your access, a banner in the app has a **Renew** button. You renew at the price you paid. Nothing renews by itself: we email you 14 and 3 days before the end and on the day it ends.



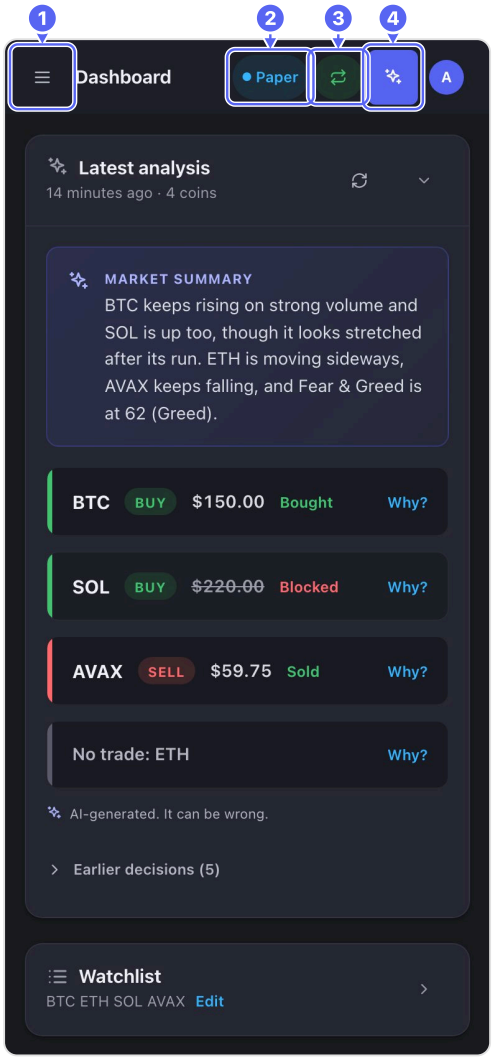
The Billing page while your access is active.

#	NAME	WHAT IT DOES
1	**Access status**	Whether your access is active, and until when.
2	**Days left**	Counts down to the end of your access.
3	**Renewal**	Renew from 30 days before the end. Your days left are kept.
4	**Reminders**	No auto-renew: we email you 14 and 3 days before it ends.
5	**Go to dashboard**	Back to the app.
6	**Receipt**	Each order with its status, coin, network and order number.
7	**Copy order ID**	Copies the order number for an email to support.

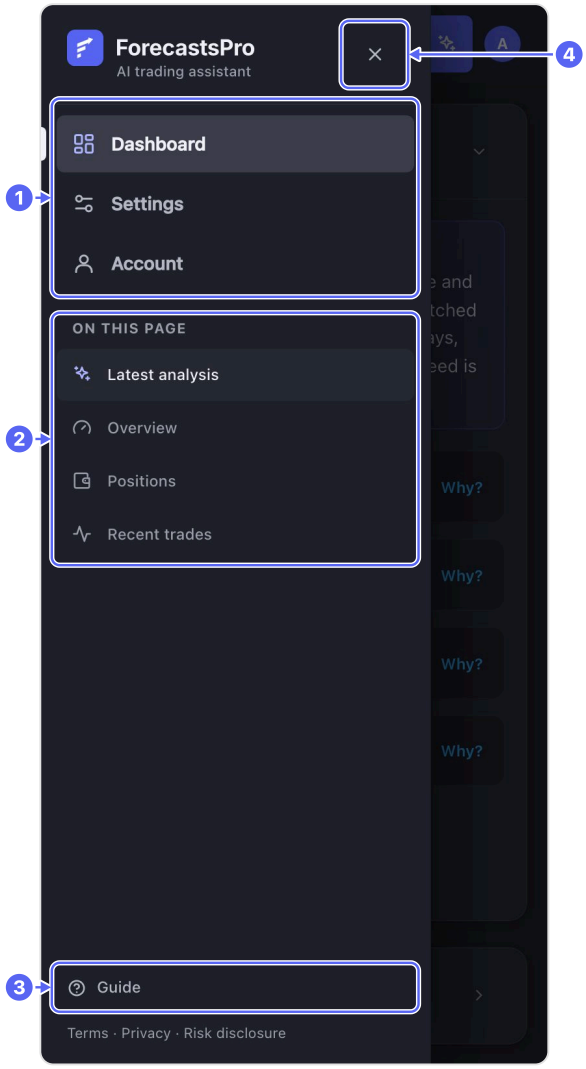
If your access ends, analyses and new trades stop. Nothing is sold. In Paper, each position keeps its stop-loss and take-profit, and they still sell when reached. In Real money, while trading and autopilot are on, the app still puts back a missing stop-loss. The Billing page still lets you switch trading off and remove your keys. After you renew, Real money is off: turn it on again in Settings (chapter 4).

On your phone

ForecastsPro works in the browser of your phone.



The dashboard on a phone.



The menu, opened.

#	NAME	WHAT IT DOES
1	**Menu**	Opens the sidebar: pages and On this page.
2	**Mode badge**	Your mode.
3	**Autopilot**	Its icon on a phone. Press it for the controls.
4	**Run analysis**	Same as on a computer.

#	NAME	WHAT IT DOES
1	**Pages**	Dashboard, Settings and Account.
2	**On this page**	Takes you to a card of this page.
3	**Guide**	This guide, on your phone too.
4	**Close**	Closes the menu.

CHAPTER 10

Glossary

Every number on a coin card, in plain words.

Press **Details** on a coin card to see these numbers. A candle is the price movement of one period, for example 1 hour (1h) or 1 day (1d).

The formulas are on forecastspro.com/math.

RSI 14 Relative Strength Index, 14 candles

Momentum from 0 to 100: recent rises against recent falls. 70 and above is called overbought, 30 and below oversold, both in amber. The card says Strong from 55, and Weak at 45 and below.

MACD 12 / 26 / 9

Compares a fast and a slow average of the price. The card says Bullish when momentum is up, Bearish when it is down.

ADX 14 Average Directional Index

How strong a trend is, up or down. From 25 the card says Trending, below that Ranging.

Volatility ATR 14 as % of price

The usual size of one candle, as a percentage of the price, from Very low to Very high. High and Very high are in amber.

Bollinger 20 candles, 2 standard deviations (%B)

Where the price sits in a band around its 20-candle average: Lower band, Mid-range, Upper band, or outside it (Above band or Below band, in amber).

Volume shown as × avg

Trading in the last 24 candles against the 24 before: 1.0× is the same, 1.3× and more is busier (green); over 2× its bar turns amber.

Fear & Greed 0 to 100

The mood of the crypto market: 0 is extreme fear, 100 extreme greed. The AI reads it as background.

Trend: 4h, 1d and others two timeframes

Up: the price is above its 50-candle average, and that average is above the 200-candle average. Down: the reverse. Sideways: anything else. Each coin gets one on two timeframes.

200 SMA distance from the 200-candle average

How far the price is above (positive) or below (negative) its 200-candle average, in percent.

The two price changes

Next to the price: the last 24 candles. Under Details: the last 168. Each label says the period, for example 4d and 28d on 4h candles.

Confidence

How sure the AI is about a decision, from 0 to 100%. Press **Why?** to see it.

Profit/loss (P&L): sold and open

Sold: the profit or loss of closed trades, at average cost and after fees. Open: what open positions would make or lose at the price now.

CHAPTER 11

Questions and help

Quick answers to what customers ask most, and real people by email.

Troubleshooting and questions

Does it work with my exchange?

Automatic trading runs on Binance. On any other exchange, use Manual mode: you place each trade by hand (chapter 5). No Binance account? Paper needs none, and no exchange keys.

Run analysis looks greyed out.

Press it: it says what is missing, for example your AI key, and shows the way there.

The analysis did not complete.

The Latest analysis card shows why, in red. Often your AI account has no credit left: press **Add credit**. Or the provider did not answer: try again in a few minutes.

A key shows Rejected.

The reason is under the field. Copy the whole key again and save it. Paper needs no exchange keys: old testnet keys can be removed (chapter 3).

A coin will not add to my watchlist.

Type only the ticker, for example BTC. The coin must trade against USDT on Binance right now, and a full watchlist (30 coins) takes no more (chapter 3).

No trades, or buys keep being blocked.

Press **Why?** on the line: it gives the AI's reason, or the gate's. A confidence block means the market is unclear; a cap block means your budget is already at work (chapter 6). Your risk level decides how often the AI acts: High also acts on smaller chances and earlier moves, with more risk (chapter 7).

I am in Paper but no trades appear.

Did an analysis run since you turned Paper on? A hold or a blocked decision places no order. A refused order says why under **Why?**, for example "Order too small for Binance."

I see a red "No stop-loss" box.

A position may have no stop-loss. In Paper there is nothing to do. In Real money, follow chapter 6.

Real money is locked.

The Trading mode card in Settings lists the safety checks left, and what each one needs (chapter 4).

The loss lock was reached.

All trading stopped and nothing was sold. Read your decision journal, then see chapter 4.

Binance stopped trading a coin I hold.

The app skips it at the next analysis, and Positions shows its price from CoinGecko, or says it has none. If it has no price for 30 minutes, the loss lock counts it as worth $0. While it has no price, no new real-money buys go out.

A waiting trade shows Expired.

A newer analysis or a newer trade replaced it. If you placed it after all, press **I placed it** (chapter 5).

In Manual mode, a coin I sold is still in my positions.

The app cannot see your exchange. Press **Sold** on that position and type what your exchange shows (chapter 5).

My Telegram alerts stopped.

A password change or reset turns them off. Connect again on the Telegram alerts card in Settings (chapter 3).

I forgot my password.

Open **Forgot password?** on the sign-in page. The reset link goes to your account's email address, and a reset signs out your other sessions.

How do I change my country or my email address?

Email support from your account's address. You can fix a typo in a new, unconfirmed address yourself, on the Account page (chapter 2).

Getting help

Write to support@forecastspro.com from your account's email address. We answer every support email within 48 hours.

- Say what you did and what you expected. A screenshot helps.
- For a payment, add the order ID: the copy button next to the order on the Billing page.
- Never send your password or your API keys. We never ask for them.

More answers on forecastspro.com: How it works, Safety, The math and the FAQ. The Terms, the Privacy Policy and the Risk Disclosure are on the Legal page.

Want to share ForecastsPro? Partners earn 50% of every sale they refer: forecastspro.com/affiliates.

You are ready.

Trade live on Binance or by hand on any exchange, or start with Paper. Read the reasoning, keep your limits steady and let the risk gate do its work.

ForecastsPro is software, not financial advice. Its analysis is AI-generated and can be wrong, and no profit is promised. Crypto assets are volatile: you can lose some or all of the money you trade. Screenshots show sample data from a preview account, not real trading results.
